By HEN W. GILL

It is true that the world is changing, and that what many people don’t realize is that the speed and pace of change is much more dramatically every year. Throughout most of human history, we learned a little about small horticultural groups, and only in the last 15,000 years did new major cities appear, with new communities to practice agriculture.

The Industrial Revolution started in Britain, and it marked the beginning of business and proclaimed the change that has replaced subsistence with abundance and enhanced civilization through its use.

All of the technology we see around us and all the conveniences we use every day have been brought to us, in the space of 10 to 12 human generations, by the first industrial revolution. The first industrial revolution started in Britain and led to the mass production of goods, such as cotton and wool, as well as the development of steam power. This led to the second Industrial Revolution, which spread throughout Europe and America, and led to the development of electricity and the use of steam power to drive machinery. The third industrial revolution has led to the development of information technology, which has had a profound impact on almost every aspect of our lives, from the way we work and communicate to the way we entertain ourselves.

The fourth industrial revolution is beginning to take place, and it will be characterized by the widespread use of artificial intelligence, the Internet of Things, and blockchain technology. The impact of this revolution will be felt in almost every aspect of our lives, from the way we work and communicate to the way we entertain ourselves.

The change brought about by the fourth industrial revolution will be significant, and it will require us to adapt and change in order to succeed.

Research has shown that, in the last 35 years, there has been a steep decline in the number of jobs where levels of social skills are unimportant. By far the greatest growth has been in jobs requiring high social skills because the modern economy creates wealth through creativity and the most effective way to foster creativity is through collaboration.
